

## Nano Liquid Ceramic H7 instructions

Nano Liquid Ceramic H7 is the ultimate exterior protection for automobile and marine craft. It can be used on paint, plastic, and glass surfaces to protect from acid rain, pollution, and other environmental contaminants.

Our Formula uses nanotechnology to create a tough, clear coating that protects your investment against even the harshest environments while keeping your vehicle looking brand new.

Nano Liquid Ceramic H7 will outlast any carnauba or montan wax. Its molecules bond with the paint to create a tough, hydrophobic, glass-like finish that will last for many months.

Nano Liquid Ceramic H7 uses a low VOC formula to comply with all State and Federal air quality regulations. It only takes 2 oz. to do a regular size vehicle and works great on metal components, plastic trim, paint, and glass.

### Installation Procedure:

*This product is easier to apply and very affordable. It is a true ceramic and will give you great results.*

1. The Vehicle should be clean and dry before applying product
2. There should be no accumulated environmental debris
3. Place a few drops of product onto an applicator sponge and apply thin coating using vertical and horizontal motions so product evenly applied.
4. If the temperature is warm, (over 90 degrees) wait about 2 minutes before wiping. If it is between 60° F and 85° F, wait about 3 minutes. If it is below 60° F wait for about 3–4 minutes.
5. Softly buff the area to a slick, high shine using a dry micro-fiber towel.

### Drying & Cure Time

Nano Liquid Ceramic H7 will dry to the touch within 10–15 minutes depending on temperature. It will take approximately 2–5 days to fully harden depending on the temperature and humidity. Hot, humid weather will cause faster curing as the coatings react with the moisture in the area to create a tough, matrix structure similar to quartz. Do not use a car wash till the curing is completed.
